Ex. 1: How to Create Files in Google Drive

Step 1: Opening Google Drive

First, I open my web browser and go to drive.google.com. If I am not already logged in, I sign in with my Google account.

Step 2: Creating a New File

I look for the large **+ New** button on the top left side of my screen and click it. A dropdown menu then appears for me.

Step 3: Choosing My File Type

- To create a Google Doc (for my notes, essays, or text documents), I click on **Google Docs**.
- To create a Google Sheet (for my data, tables, or spreadsheets), I click on **Google Sheets**.

Step 4: Naming My File

My new file opens in a new browser tab. By default, it is named "Untitled document" or "Untitled spreadsheet". I click on that title in the top-left corner of my screen and type in my desired file name (for example, "My Lab Exercise Notes"). My file is automatically saved to my Google Drive as I type!

Ex. 2: How to Launch a Linux Virtual Machine

Step 1: Download Requirements

1. I download and install VMware Workstation Player or Pro.
2. I download the Ubuntu Linux ISO file.

Step 2: Create and Configure the VM

1. I open VMware and click "Create a New Virtual Machine".
2. I browse for my downloaded Linux ISO file and select it.
3. I configure my VM settings, such as memory allocation and the number of processors.

Step 3: Install and Launch Linux

1. I power on the virtual machine and follow the on-screen instructions to install Linux.
2. Once the installation is complete, I log into my new Linux VM using the credentials I set up.

Ex. 3: How to Host a Static Website on GitHub

Step 1: Create My Repository

1. I log into github.com, click the **+** icon, and select **New repository**.
2. I name it (using `myusername.github.io` for a personal site, or any name for a project), set it to **Public**, and click **Create repository**.

Step 2: Upload My Files

1. I click the **uploading an existing file** link on my new repository page.
2. I drag and drop my website files (making sure the main file is `index.html`) and click **Commit changes**.

Step 3: Go to Settings

1. I open the **Settings** tab located at the top of my repository.
2. I scroll down the left menu and click on **Pages**.

Step 4: Deploy My Site

1. Under the "Build and deployment" section, I set the source to **Deploy from a branch**.
2. I select my primary branch (`main` or `master`) and the `/root` folder, then click **Save**.
3. I wait a minute, refresh the page, and my live URL is displayed at the top!

Ex. 4: How to Explore Google Cloud

Step 1: Set Up My Account

1. I go to the Google Cloud Console and sign in with my Google account.
2. I navigate to the "Billing" section and add my billing information.

Step 2: Create a New Bucket

1. I click on **Storage** and select **Create new bucket**.
2. I enter a unique name for my bucket, choose "Region" as the location type, select "Standard" for the storage class, and click **Create**.

Step 3: Upload an Image

1. I click on my newly created bucket to open it.
2. I click **Upload files**, select a JPEG image from my computer, and rename the uploaded file to `myimage.jpg`.

Step 4: Manage My Calendar

1. I open Google Calendar and select a date and time.
2. I create an event, type the event name, customize the color and font, and click **Save** so I receive a notification on my PC.
